Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:** 

1-27. (Canceled)

28. (Currently Amended) A deck system comprising:

a plurality of boards operable to extend across a plurality of laterally spaced joists, each of

said boards presenting an upper lip and a lower lip, said upper and lower lips defining

a pair of longitudinally extending grooves on generally opposite sides of the board,

and said lower lip having a thickness "E"; and

a plurality of generally T-shaped fasteners each operable to rigidly couple to the joists, each

of said fasteners presenting a base and a pair of protrusions having a height "F," each

of the protrusions extending generally perpendicularly from a vertical axis of the

fastener, each of said protrusions further operable to be received in a respective

groove of a respective board in a substantially complemental fashion, wherein "F" is

the average vertical distance from the base to the protrusions and "E" is at least 1%

greater than "F."

-2-

Application No. 10/634,499

Amendment Dated December 21, 2006

Reply to September 27, 2006, Office Action

29. (Previously Presented) The system of claim 28, wherein "E" is at least about 2% greater

than "F."

30. (Previously Presented) The system of claim 29, wherein "E" is at least about 5% greater

than "F."

31. (Previously Presented) The deck system of claim 28, wherein the protrusions exert a

downward holding force on the lower lips when the protrusions are at least partially received within

the grooves.

32. (Previously Presented) The deck system of claim 31, wherein the downward holding

force is due to the thickness of the lower lips being at least 1% greater than the height of the

protrusions.

33. (Previously Presented) The deck system of claim 31, wherein the downward holding

force inhibits upward movement of the boards relative to the fasteners and joists.

34. (Previously Presented) The deck system of claim 31, wherein the fasteners are comprised

of a resilient material that allows the protrusions to be elastically flexed when the protrusions are at

least partially received within the grooves.

-3-

35. (Previously Presented) The deck system of claim 34, wherein the flexing of the

protrusions facilitates maintaining the downward holding force on the lower lips.

36. (Previously Presented) The deck system of claim 28, wherein the fasteners securely

couple the boards to the joists when the protrusions are at least partially received within the grooves.

37. (Currently Amended) A deck system comprising:

a first board operable to extend across and be supported by a plurality of joists, the first

board presenting a pair of similarly configured opposite sides, each of the sides

including upper and lower longitudinally extending lips presenting opposing

inwardly facing surfaces; and

a generally T-shaped fastener operable to be rigidly coupled to at least one of the joists, the

fastener presenting a base and at least one protrusion, the protrusion extending

generally perpendicularly from a vertical axis of the fastener, the protrusion being

operable to contact both of the inwardly facing surfaces on one of the sides of the

first board to continually exert a first downward holding force on the lower lip to

force the first board towards the joist; wherein the thickness of the lower lip is at least

1% greater than the average vertical distance from the base to the protrusion

-4-

38. (Previously Presented) The deck system of claim 37, wherein the first holding force more

securely couples the first board to the joist than if no first holding force is applied.

39. (Previously Presented) The deck system of claim 37, wherein the protrusion is formed

of a resilient material such that the protrusion flexes to facilitate exertion of the first holding force.

40. (Previously Presented) The deck system of claim 37, wherein the first holding force

inhibits upward movement of the first board relative to the fastener and joists.

41. (Canceled)

42. (Previously Presented) The deck system of claim 37, wherein the thickness of the lower

lip is at least 2% greater than the average vertical distance from the base to the protrusion.

43. (Previously Presented) The deck system of claim 42, wherein the thickness of the lower

lip is at least 5% greater than the average vertical distance from the base to the protrusion.

44. (Previously Presented) The deck system of claim 37, wherein the first holding force

securely couples the first board to the joists.

-5-

45. (Previously Presented) The deck system of claim 37, wherein the deck system includes a second board, the second board being substantially similar to the first board, wherein the fastener exerts a second downward holding force on the second board such that the first holding force and the second holding force inhibit movement of the first board and second board relative to the joists thereby forming a more rigid deck system than if the holding forces were not present.

- 46. (Currently Amended) A method of coupling a plurality of boards to a plurality of support members, the method comprising the steps of:
  - rigidly attaching a first generally T-shaped fastener to a first support member, the first fastener having a base and at least one protrusion, the protrusion extending generally perpendicularly from a vertical axis of the fastener;
  - (b) positioning a first board across the first support member and against the rigidlyattached first fastener such that the protrusion of the first fastener is at least partially
    received in a first longitudinal groove of the first board to form a mating relationship
    between the first board and the first fastener, wherein the positioning of the first
    board and the first fastener in the mating relationship causes the protrusion of the first
    fastener to flex and exert a first downward holding force on the first board, whereinthe longitudinal groove is generally defined by a upper lip and a lower lip,
    the first holding force is exerted against the lower lip, and
    the thickness of the lower lip is at least 1% greater than the average vertical
    distance from the base to the protrusion;
  - (c) positioning a second fastener against the first board such that a protrusion of the second fastener is at least partially received in a second longitudinal groove of the first board to form a mating relationship between the first board and the second fastener; and

Application No. 10/634,499

Amendment Dated December 21, 2006

Reply to September 27, 2006, Office Action

(d) rigidly attaching the second fastener to the first support member while maintaining

the mating relationship between the first board and the first and second fasteners.

47. (Previously Presented) The method of claim 46, wherein the first holding force inhibits

movement of the first board relative to the first fastener and the first support member.

48. (Previously Presented) The method of claim 46, wherein the first holding force holds the

first board against the first support member.

49. (Previously Presented) The method of claim 46, wherein rigidly attaching the second

fastener to the first support member causes the protrusion of the second fastener to flex and exert a

second downward holding force on the first board.

50. (Previously Presented) The method of claim 49, wherein the first and second holding

forces are exerted on generally opposite sides of the first board.

51. (Previously Presented) The method of claim 49, wherein the first and second holding

forces hold the first board against the first support member.

-8-

- 52. (Previously Presented) The method of claim 49, wherein the first and second holding forces securely couple the first board to the first support member.
  - 53. (Canceled)
  - 54. (Canceled)
- 55. (Previously Presented) The method of claim 46, wherein the thickness of the lower lip is at least 2% greater than the average vertical distance from the base to the protrusion.
- 56. (Previously Presented) The method of claim 55, wherein the thickness of the lower lip is at least 5% greater than the average vertical distance from the base to the protrusion.
  - 57. (Previously Presented) The method of claim 46; and
- (e) positioning a second board across the first support member and against the second fastener to thereby form a mating relationship between the second board and the second fastener.
- 58. (Previously Presented) The method of claim 57, wherein the second fastener is disposed generally between the first and second boards.

- 59. (Previously Presented) The method of claim 58, wherein the second fastener causes a gap to be maintained between the first and second boards.
- 60. (Previously Presented) The method of claim 57, wherein the holding force inhibits movement of the boards relative to one another, movement of the support members relative to one another, and movement of the boards relative to the support members, thereby forming a more rigid deck system than if the holding force were not present.

- 61. (Currently Amended) A method of coupling a plurality of boards to a plurality of support members, the method comprising the steps of:
  - (a) rigidly attaching a first board to a first support member, the first board having a longitudinal groove generally defined by an upper lip and a lower lip;
  - (b) positioning a first generally T-shaped fastener against the rigidly attached first board to form a mating relationship between the first board and the first fastener, the first fastener having a base and a first and a second protrusion, each of said protrusions extending generally perpendicularly from a vertical axis of the fastener, the thickness of the lower lip being at least 1% greater than the average vertical distance from the base to the first protrusion, the first fastener positioned such that the first protrusion is at least partially received in the longitudinal groove;
  - (c) rigidly attaching the first fastener to the first support member while maintaining the mating relationship between the first board and the first fastener; and
  - (d) positioning a second board having a second longitudinal groove against the first fastener such that the second protrusion is at least partially received in the second longitudinal groove to form a mating relationship between the second board and the first fastener.
